

JAVA STRING OPERATIONS

Quick one-line revision sheet

Operation	Single-line explanation
charAt()	Returns the character at the specified index of a string.
concat()	Joins the specified string to the end of the current string.
contains()	Checks whether the string contains the specified sequence of characters.
createString	Creates a String object using a literal or the new String() constructor.
equals()	Compares two strings and returns true only when their contents are exactly equal.
equalsIgnoreCase()	Compares two strings for equality without considering uppercase or lowercase.
indexOf()	Returns the index of the first occurrence of a specified character or substring.
lastIndexOf()	Returns the index of the last occurrence of a specified character or substring.
length()	Returns the total number of characters present in the string.
replace()	Replaces all matching occurrences of a character or substring with another value.
substring()	Returns a part of the string between the specified index positions.
toLowerCase()	Converts all letters in the string to lowercase.
toUpperCase()	Converts all letters in the string to uppercase.
trim()	Removes leading and trailing whitespace from the string.

Note: String indexes start from 0. Java String objects are immutable, so most operations return a new String.
